

1 - Introduction to NetworkX

Drew Conway and Aric Hagberg

February 8, 2011

Vast amounts of data are being generated and collected

- ▶ **Sociology:** WWW, email, social networking
- ▶ **Technology:** Internet, telecommunications, power grid
- ▶ **Biology:** protein interactions, genetic regulatory networks, epidemiology

Need theory, analysis, models

Example: interdiction

Problem: smuggling of nuclear material in transportation network

Detector at border crossing

Find best set of roads (edges) to monitor (cut) with limited budget

University libraries, journals, and aggregators collect journal usage data through web portals

MESUR project is analyzing about 1 billion usage events

Build network from user click streams

- ▶ Do scholars read and cite journals in the same way?
- ▶ Can new trends in research (new field, interdisciplinary) be spotted?
- ▶ Which journals are most important according to usage?

Johan Bollen, Los Alamos

Example: journal usage network

NetworkX project: goals and features

Goals: Why we started project

We needed:

- ▶ Tool to study the structure and dynamics of social, biological, and infrastructure networks
 - ▶ Ease-of-use and rapid development in a collaborative, multidisciplinary environment
 - ▶ Open-source tool base that can easily grow in a multidisciplinary environment with non-expert users and developers
 - ▶ An easy interface to existing code bases written in C, C++, and FORTRAN
 - ▶ To painlessly slurp in large nonstandard data sets
-
- ▶ No existing API or graph implementation that was suitable
 - ▶ Inspired by Guido van Rossum's 1998 Python graph representation essay
 - ▶ First public release in April 2005

Features: NetworkX in one slide

- ▶ Python language package for exploration and analysis of networks and network algorithms
- ▶ Data structures for representing many types of networks, or graphs, (simple graphs, directed graphs, and graphs with parallel edges and self loops)
- ▶ Nodes can be any (hashable) Python object
- ▶ Edges can contain arbitrary data
- ▶ Flexibility ideal for representing networks found in many different fields
- ▶ Many unit and functional tests
- ▶ Online up-to-date documentation

NetworkX defines no custom node objects or edge objects

- ▶ “node-centric” view of network
- ▶ Nodes: whatever you put in (hashable)
- ▶ Edges: tuples with optional edge data (stored in dictionary)
- ▶ Edge data is arbitrary and users can define custom node types

NetworkX is all Python

(Other projects use custom compiled code and Python: Boost Graph, igraph, Graphviz)

- ▶ Focus on computational network modeling not software tool development
- ▶ Move fast to design new algorithms or models

Start Python

Import NetworkX using “nx” as a short name

```
>>> import networkx as nx
```

The basic Graph class is used to hold the network information. Nodes can be added as follows:

```
>>> G=nx.Graph()
>>> G.add_node(1) # integer
>>> G.add_node('a') # string
>>> print G.nodes()
['a', 1]
```

Feature: nodes can be “anything”

Nodes can be any hashable object such as strings, numbers, files, functions, and more

```
>>> import math
>>> G.add_node(math.cos) # cosine function
>>> fh=open('tmp.txt', 'w')
>>> G.add_node(fh) # file handle
>>> print G.nodes()
[<built-in function cos>,
<open file 'tmp.txt', mode 'w' at 0x30dc38>]
```

Feature: edges are just pairs of nodes

Edges, or links, between nodes are represented as tuples of nodes. They can be added simply

```
>>> G.add-edge(1, 'a')
>>> G.add-edge('b', math.cos)
>>> print G.edges()
[('b', <built-in function cos>), ('a', 1)]
```

If the nodes do not already exist they are automatically added to the graph.

Feature: Edge can hold arbitrary data

Any Python object is allowed as edge data
(e.g. number, string, image, file, ip address)
Edge data assigned and stored in a Python
dictionary (default empty).

Use Dijkstra's algorithm to find the shortest path:

```
>>> G=nx. Graph()
>>> G. add-edge(' a' , ' b' , wei ght=0. 3)
>>> G. add-edge(' b' , ' c' , wei ght=0. 5)
>>> G. add-edge(' a' , ' c' , wei ght=2. 0)
>>> G. add-edge(' c' , ' d' , wei ght=1. 0)
>>> print nx. shortest-path(G, ' a' , ' d' )
[' a' , ' c' , ' d' ]
>>> print nx. shortest-path(G, ' a' , ' d' , wei ghted=True)
[' a' , ' b' , ' c' , ' d' ]
```

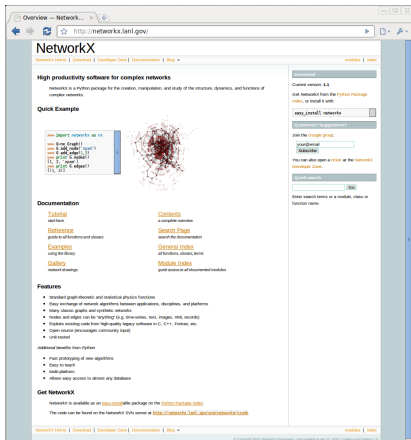

NetworkX has many tests that can be run by users

```
>>> import networkx
>>> networkx.test(verbosity=2)
...
Doctest: networkx.utils ... ok
Conversion from digraph to array to digraph. ... ok
Conversion from digraph to matrix to digraph. ... ok
Conversion from graph to array to graph. ... ok
Conversion from graph to matrix to graph. ... ok
Conversion from weighted digraph to array to weighted digraph. ... ok
...
Conversion from non-square array. ... ok
Conversion from digraph to sparse matrix to digraph. ... ok
Conversion from graph to sparse matrix to graph. ... ok
Conversion from weighted digraph to sparse matrix to weighted digraph. ... ok
Conversion from weighted graph to sparse matrix to weighted graph. ... ok
Conversion from graph to sparse matrix to graph with nodelist. ... ok
Conversion from non-square sparse array. ... ok
Doctest: networkx ... ok

-----
Ran 855 tests in 4.334s

OK
```

Feature: Online, up-to-date documentation

The screenshot shows the NetworkX website homepage. The browser address bar displays "http://networkx.lanl.gov/". The page has a navigation bar with links: "NetworkX", "Download", "Developer Zone", "Documentation", and "Blog". The main content area is titled "High productivity software for complex networks" and describes NetworkX as a Python package for creating, manipulating, and studying the structure, dynamics, and functions of complex networks. A "Quick Example" section shows a code snippet for creating a graph and finding its components. A network diagram is displayed next to the code. The "Documentation" section includes links to "Tutorial", "Reference", "Examples", and "Gallery". The "Features" section lists various capabilities like graph-theoretic functions, easy exchange of network algorithms, and support for various data sources. The "Get NetworkX" section provides information on how to install the package and where to find the code.

High productivity software for complex networks

NetworkX is a Python package for the creation, manipulation, and study of the structure, dynamics, and functions of complex networks.

Quick Example

```
import networkx as nx
G = nx.Graph()
G.add_weighted_edges_from([(1,2,0.1), (1,3,0.7), (2,3,0.4)])
cc = nx.connected_components(G)
len(list(cc))
```

Documentation

- [Tutorial](#)
Get here
- [Reference](#)
guide to all functions and classes
- [Examples](#)
using the library
- [Gallery](#)
network drawings

Features

- Standard graph-theoretic and statistical physics functions
- Easy exchange of network algorithms between applications, disciplines, and platforms
- Easy class graphs and complex networks
- Nodes and edges can be "anything" (e.g. time-series, text, images, etc. records)
- Flexible scripting code from high-quality "legacy" software in C, C++, Fortran, etc.
- Open source (perceives community input)
- Linux tested

Additional benefits from Python

- Fast prototyping of new algorithms
- Easy to teach
- Web platform
- Almost easy access to almost any database

Get NetworkX

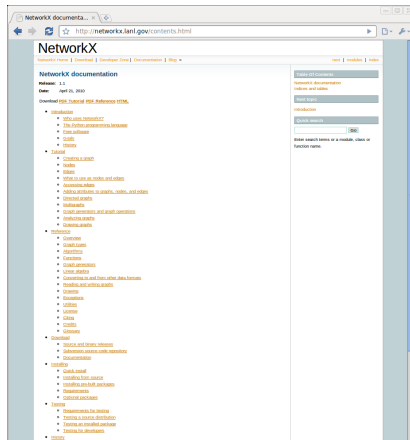

NetworkX is available as an [easy-to-install](http://sourceforge.net/projects/networkx) package on the [SourceForge](http://sourceforge.net/projects/networkx) website.

The code can be found on the NetworkX GitHub server at <https://github.com/networkx/networkx>

Python is easy to write and read

Breadth First Search

```
from collections import deque

def breadth-first-search(g, source):
    queue = deque([(None, source)])
    enqueued = set([source])
    while queue:
        parent, n = queue.popleft()
        yield parent, n
        new = set(g[n]) - enqueued
        enqueued |= new
        queue.extend([(n, child) for child in new])
```

2 The model

We consider a directed graph which grows by adding single edges at discrete time steps. At each such step a vertex may or may not also be added. For simplicity we allow multiple edges and loops. More precisely, let α , β , γ , δ_{in} and δ_{out} be non-negative real numbers, with $\alpha + \beta + \gamma = 1$. Let G_0 be any fixed initial directed graph, for example a single vertex without edges, and let t_0 be the number of edges of G_0 . (Depending on the parameters, we may have to assume $t_0 \geq 1$ for the first few steps of our process to make sense.) We set $G(t_0) = G_0$, so at time t the graph $G(t)$ has exactly t edges, and a random number $n(t)$ of vertices. In what follows, *to choose a vertex v of $G(t)$ according to $d_{out} + \delta_{out}$* means to choose v so that $\Pr(v = v_i)$ is proportional to $d_{out}(v_i) + \delta_{out}$, i.e., so that $\Pr(v = v_i) = (d_{out}(v_i) + \delta_{out}) / (t + \delta_{out}n(t))$. To *choose v according to $d_{in} + \delta_{in}$* means to choose v so that $\Pr(v = v_i) = (d_{in}(v_i) + \delta_{in}) / (t + \delta_{in}n(t))$. Here $d_{out}(v_i)$ and $d_{in}(v_i)$ are the out-degree and in-degree of v_i , measured in the graph $G(t)$.

For $t \geq t_0$ we form $G(t+1)$ from $G(t)$ according to the following rules:

(A) With probability α , add a new vertex v together with an edge from v to an existing vertex w , where w is chosen according to $d_{in} + \delta_{in}$.

(B) With probability β , add an edge from an existing vertex v to an existing vertex w , where v and w are chosen independently, v according to $d_{out} + \delta_{out}$, and w according to $d_{in} + \delta_{in}$.

(C) With probability γ , add a new vertex w and an edge from an existing vertex v to w , where v is chosen according to $d_{out} + \delta_{out}$.

Feature: Compact code - building new generators

```
1 import bisect
2 import random
3 from networkx import MultiDiGraph
4
5 def scale_free_graph(n, alpha=0.41,beta=0.54,delta_in=0.2,delta_out=0):
6     def _choose_node(G, distribution , delta ):
7         cumsum=0.0
8         psum=float (sum( distribution . values ())+ float (delta)*len (distribution))
9         r=random.random()
10        for i in range(0,len (distribution )):
11            cumsum+=(distribution [i]+ delta )/psum
12            if r < cumsum:
13                break
14        return i
15
16    G=MultiDiGraph ()
17    G.add_edges_from([(0,1),(1,2),(2,0)])
18    gamma=1-alpha-beta
19
20    while len(G)<n:
21        r = random.random()
22        if r < alpha:
23            v = len(G)
24            w = _choose_node(G, G.in_degree (), delta_in)
25        elif r < alpha+beta:
26            v = _choose_node(G, G.out_degree (), delta_out)
27            w = _choose_node(G, G.in_degree (), delta_in)
28        else:
29            v = _choose_node(G, G.out_degree (), delta_out)
30            w = len(G)
31        G.add_edge(v,w)
32    return G
```

Feature: leveraging libraries

Use well-tested numerical and statistical libraries

E.g. convert Graphs to and from NumPy (and SciPy sparse) matrices

Example: Find eigenvalue spectrum of the graph Laplacian

```
>>> L=nx.laplacian(G)
>>> print L # a NumPy matrix
[[ 1. -1.  0.  0.  0.  0.]
 [-1.  2. -1.  0.  0.  0.]
 [ 0. -1.  2. -1.  0.  0.]
 [ 0.  0. -1.  2. -1.  0.]
 [ 0.  0.  0. -1.  2. -1.]
 [ 0.  0.  0.  0. -1.  1.]]
>>> import numpy.linalg
>>> print numpy.linalg.eigvals(L)
[ 3.7321e+00  3.0000e+00  2.0000e+00
 1.0000e+00 -4.0235e-17  2.6795e-01]
```

Feature: drawing

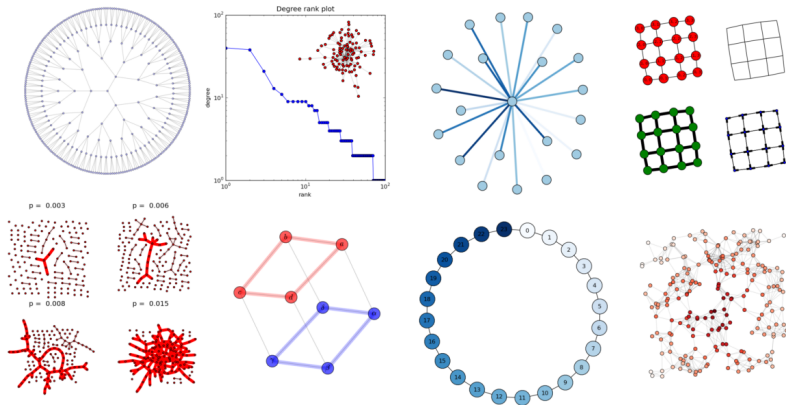

Built-in interface to Matplotlib plotting package

Node positioning algorithms based on force-directed, spectral, and geometric methods

```
>>> G = nx.circular_ladder_graph(12)  
>>> nx.draw(G) # Matplotlib under the hood
```

Drawing with Matplotlib

Output to: dot, GML, LEDA, edge list, adjacency list, YAML, sparsegraph6, GraphML

Where is NetworkX being used?

Adding red edges allows network to synchronize.
Edges found by studying network Laplacian spectrum.
